

Cornell MBA Johnson Consulting Club Casebook 2021-2022

Casino Royale

Behavioral Case Question

Spend 15 Minutes on:

- Describe a time when you worked in a high-functioning team

Case Prompt

Our client is Casino Royale, a luxurious casino on the coast of Montenegro. Recently, Casino Royale closed a series of slot machines after losing several jackpots in the period of six months. Casino Royale has asked for our assistance in determining what they should do with this floor space instead.

Casino Royale

Case Information

There are two important clarifying questions for the interviewee to ask:

1) Is there a goal in determining what to do with the floor space?

Yes, Casino Royale is a casino and wants to make as much money as possible.

2) How big is the floor space and where is it located?

Casino Royale has closed 4 slot machines, which is the equivalent of one table game. The slot machines were located in the center of the casino floor.

If the interviewee does not ask this question, lead them to think about it before they build a structure. This question will help the interviewee narrow their focus on the problem. There is a big difference between structuring the problem if the casino closed 50 slot machines against the wall of the casino and four in the middle of the floor.)

Additional Question:

What games does Casino Royale have?

Casino Royale offers blackjack, poker, slots, roulette, and craps

Approach/ Analysis (Structuring)

Structure suggestions

Structure should focus on what to do with floor space. All answers should drive at increasing profitability.

Approach 1:

Existing Games

- Which game is most profitable?
- What is demand for games?
- How does casino make money from each game?

New Games

- Are there any games at neighboring casinos worth installing?
- What new games are customers interested in?

Alternatives

- Can casino royale use the floor space for something else (e.g. restaurant, bar, massage tables, etc.)?

Approach 2: Three C's Approach

**Casino Royale (Company), Gamblers (Customers),
Neighboring Casinos (Competition)**

Casino Royale

Approach / Analysis

Exercise 1: Revenue Considerations

Prompt One:

Casino Royale has done some due diligence and decided to add one table game in place of the slot machines. It has narrowed its options down to Blackjack and Poker. What information would you want to know?

The interviewee should build a mini-structure designed to assess the profitability of one table of blackjack vs. one table of poker. Information sought should include Revenue (# of players, # of seats, \$ wagered per hand, % of hands won and lost/% charged by casino per hand, hours of operation, etc.) and Costs (Dealer salaries, operating expenses, table costs, chips, cards, security, drinks, etc.)

Before moving on make sure the interviewee understands how a casino makes money from both games:

- Blackjack is a game where the gambler bets against the house (casino). The odds are slightly in the casino's favor to ensure that it wins in the long-run.
- Poker is a game where the gambler bets against other gamblers. The casino earns money by taking a rake (a percentage of the total pot each hand).

Once the interviewee has completed their mini-structure, you can provide the following information:

Blackjack Considerations

- Blackjack table seats 5 players at a time
- The average capacity of a blackjack table is 80%
- The average wager of a player is \$25 per hand

Casino Royale

Approach/ Analysis (Exercise 1: Revenue Considerations)

- A player averages 40 hands per hour
- The casino wins 60% of the Blackjack hands
 - *This implies casino also loses 40% of blackjack hands – DO NOT PROVIDE THE LOSS INFORMATION*

Poker Considerations

- Casino Royale charges a 5% rake (takes 5% of total pot ea. hand)
- Average hand at a poker table is \$300
- There is an average of 50 hands per hour at a table

Additional Considerations

- Both tables are open for 20 hours per day
- Operating costs (dealers, cards, security) are the same

Given this information, which game earns more money per day?

Blackjack Calculations:

Expected Calculation

$(\# \text{ of seats} * \text{Avg. Capacity}) = \text{Avg. Players at table}$

$(5 \text{ seats} * 80\% \text{ capacity}) = 4 \text{ players on avg. at table}$

$(\text{Avg. wager} * \text{Avg. hands/hour} * \# \text{ hours}) = \text{Avg. revenue per player}$

$(\$25 * 40 \text{ hands per hour} * 20 \text{ hours}) = \$20,000 \text{ per player per day}$

Casino Royale

Approach / Analysis

(Avg. players at table * Avg. revenue per player * Casino win %)
(4 players * \$20,000 * (60%-40%***)) = **\$16,000**

***Candidate needs to subtract 40% of losses to arrive at revenue

Poker Calculations

Expected Calculation

(Avg. pot size * Casino rake) = Avg. revenue per hand played
(\$300 per hand * 5% casino rake) = \$15 per hand

(Avg. rev per hand * Avg. # hands per hour * Avg hours)
(\$15 per hand * 50 hands per hour * 20 hours) = **\$15,000**

Note: Operating costs are equal, so only need to calculate revenue

Candidate should notice:

- Blackjack makes \$1,000 more per day than poker
- Costs are not a factor (operating both games costs the same) so for the purpose of this exercise, we only need to focus on revenue

Casino Royale

Approach / Analysis

An excellent candidate will notice:

- Blackjack 60% win rate is not the casino's revenue. The casino also loses 40% of the blackjack hands. Shortcut is to take 20% (60%-40%) of total money bet on the table per day.
- Poker is less risky. In poker, the casino earns \$15,000 a day without the possibility of losing. In blackjack, the average return is \$16,000 per day, but there's the possibility to incur significant losses on a day-to-day basis.
- From this, it may be inferred that Poker is the optimal choice, but the interviewer should remind the candidate that these are averages and in the long-run the casino will make a 20% margin on Blackjack
- Annualized return for casino (CEO level insight) is \$1,000 per day is \$365,000 more per year – **lot of money!!!**

Interviewee should drive out of Exercise One with Blackjack as the recommendation.

Exercise 2: High Roller Considerations

Prompt Two:

Casino Royale has decided to move forward with Blackjack. However, after recent inspiration from the James Bond movie "Casino Royale", the casino is considering making this Blackjack table a "High-Rollers" table.

(Provide the candidate with the following information)

High Roller Blackjack Considerations

- High Rollers wager \$1,000 per hand
- High Rollers play 2 hands at a time

Casino Royale

Approach / Analysis

- High Roller plays 30 hands per hour and typically play for 1 hour
- Due to the nature of High-Rollers, the casino provides incentives to its elite clientele. Every high roller receives a comped room, bottle of champagne and dinner on the house. This amounts to \$6,000 per high roller.

Ask the interviewee the following questions (wait for answer to 1 before asking 2):

1. What % of hands would the casino need to win to break-even on a high-roller that plays for 1 hour?
2. Should the Casino make this table high roller?

What % of hands would the casino need to win to break-even on a high roller that plays for one hour?

Expected Calculation

(Avg. wager * Avg. hands played * Avg. hands/hour) = Avg. Rev per hour

(\$1,000 * 2 hands played * 30 hands/hour) = \$60,000

Total Costs per High Roller = \$6,000

To calculate win % needed to BE, candidate should setup:

$\$60,000 * (\text{win } \%) = \$6,000 \rightarrow \text{Win } \% = \$6,000 / \$60,000 = \underline{\underline{10\%}}$

Note: 10% represents the marginal win %, candidate should recognize that the actual win % required is **55% of hands**

(55% win – 45% loss = 10% breakeven)

Casino Royale

Approach / Analysis

Should the casino make this table a high rollers table?

Note: *the interviewee can assume that the casino still expects to win 60% (and lose 40%) of the hands for high rollers.*

Expected Calculation

$\$60,000 * 20\% \text{ (win rate)} = \$12,000 - \$6,000 \text{ (fixed costs)} = \$6,000 \text{ per hr}$

Ensure that the interviewee is making an apples-to-apples comparison. The expected return for one high roller in one hour is \$6,000 while the expected return from a twenty-hour day at a regular blackjack table is \$16,000.

Expected Calculation

If the interviewee struggles, ask them to think about how many hours or players they would need at a high roller table to make more money?

Regular blackjack = $\$16,000 / \$6,000 = 2 \frac{2}{3} \text{ hours/players} \sim \mathbf{3 \text{ hrs/plyrs}}$

Ask the interviewee does it seem doable to get 3 players at a high roller table per day?

Casino Royale

Approach / Analysis

The interviewee should conclude that given a regular blackjack table is operating at 80% capacity for twenty hours a day, it seems likely that the casino can attract 3 high rollers for one hour or 3 hours of play per day. While there's no information on high roller demand, interviewee should recognize potential for upside and recommend high roller table.

Candidate should notice:

- High-Rollers wager \$60,000 per hour
- In one hour, Casino Royale would need to win 10% more hands than it loses to Breakeven on the comped gifts for high roller
- With the regular win rate margin of 20%, Casino Royale can expect to exceed the Breakeven point and make money on high rollers as long as it's able to attract over 3 high rollers or 3 hours of play

An excellent candidate will notice:

- There are two levers the casino can pull for high rollers: players and hours
- Increasing the amount of time a High Roller stays at the table or the number of hands it plays will increase payoff for Casino Royale.
- In fact, getting a high roller to play for two hours is more profitable than getting two high rollers for one hour. The \$6,000 benefits package is a fixed cost. The casino can expect to earn \$12,000 for every additional hour a player spends at the table.

Casino Royale

Approach / Analysis

Exercise three: Brainstorm

Unfortunately, Casino Royale's Marketing Director is on vacation in Las Vegas. They've asked for our help in launching a new campaign for this High Roller table. What are some things Casino Royale should consider to attract High Rollers?

Expected Actions:

Brainstorm should be structured to focus on things the casino can do to attract high rollers. Potential approaches can include:

- New vs. existing clients
- Game play vs. non-game play
- Players vs. hours

Interviewee should recognize that the target audience for high rollers are extremely affluent. These players are wagering \$60,000 per hour. These people have a lot of money and we need to think about what attracts these types of players.

Recommended approach is to focus on experience and make sure these casino guests are treated like royalty and have such a good time they don't worry about losing money at the tables. Ideas can include parties, private jets, wagyu steaks, caviar, private chefs, etc.

Casino Royale

Approach / Analysis

Conclusion

The President of Casino Royale is walking through the casino floor in a few minutes. She's asked for your recommendation:

Summary:

- Casino Royale earns \$16,000 per day for Blackjack at win rate of 20%, \$15,000 per day for Poker and breaks even on a high-roller in one hour at a win rate of 10%.

Recommendation:

- High roller table offers the greatest profitability opportunity
- At 20% win-rate, one high roller playing for an hour earns \$6,000
- In 3 hours, Casino Royale will earn more from High Rollers than it does in 20 hours of regular blackjack table
- Alternative is to make table regular blackjack during the day (expecting 80% occupancy) and convert to high roller at nights and weekends

Risks:

- Unclear what high roller demand is
- Shorter player time for high rollers can lead to significant losses

Next Steps:

- Perform due diligence on demand for high rollers to ensure can cross the 3 player/hour per day benchmark
- Build table, engage marketing department to prepare packages for high rollers and invite elite clientele to table launch

Caribbean Restaurant

Business Situation

Your client is a successful entrepreneur with a history of opening high quality restaurants in beautiful locations.

He is considering a site for a new restaurant and is wondering if it's feasible to open a restaurant on St. John, a small Caribbean island that is a US territory with 5000 residents.

He is quite confident in his capabilities to open a restaurant, but only wishes to do so if the first year operating profits exceed \$3MM. Is the market for restaurant dining on St. John large enough to support this goal?

Problem Statement (Notes for interviewer)

LEK Style Quant Case

Information to be provided before structure as requested:

1. One million tourists visit St. John annually
2. Tourists can be expected to eat three meals daily (breakfast, lunch and dinner)
3. Tourists (who stay at resorts, hotels or rental homes), have two options for dining: groceries or restaurants
4. Groceries on a per person basis are cheaper than restaurants when feeding people
5. There are 25 restaurants currently operating on island, and all serve breakfast, lunch and dinner

Caribbean Restaurant

Approach / Analysis [Provide Exhibit 1]

A **strong candidate** will take a moment to structure her approach, which is likely to include the following:

Sizing total addressable market for restaurant dining on island

Estimating reasonable penetration/market share for first year

Make assumption regarding operating margin, benchmarked against \$3MM goal

Allow candidate to work through market sizing, providing this information as needed.

Candidate should drive, providing justification for assumptions.

- 1MM tourists visit St. John annually
- Assume the 5000 local residents have negligible effect on market relative to tourists-a strong candidate will point this out
- Operating margin for a decent restaurant = 10%
- There are 25 existing restaurants on island
- Reasonable to forecast initial penetration at ~4% (1/25)
- Tourists can be segmented into “Wealthy”, “Average” and “Budget” travelers

Wealthy

- 10% of tourists
- Stay for an average of 10 days
- Eat breakfast, lunch and dinner at restaurants each day

Caribbean Restaurant

Approach / Analysis [Provide Exhibit 2]

- Breakfast/Lunch Spend per meal : \$40 per person
- Dinner Spend per meal: \$100 per person (they buy lots of wine)

Average

- 60% of tourists
- Stay for an average of 7 days
- Eat breakfast OR lunch at restaurants each day, and eat dinner at restaurants each day
- Breakfast/Lunch Spend per meal: \$20 per person
- Dinner Spend per meal: \$60 per person

Budget

- 30% of tourists
- Stay for an average of 4 days
- Eat two breakfast/lunches and two dinners at restaurants total throughout their stay
- Breakfast/Lunch Spend per meal: \$15 per person
- Dinner Spend per meal: \$40 per person

Caribbean Restaurant

Possible Market Sizing Tree (do not show candidate)

Caribbean Restaurant

Data table/Math answers

	A	B	C	D	E	F	G	H
Segment	Daily Eating Habits		Length of stay (Days)	Avg Spend		Spend Per Person Per Trip	% of Total Tourists	Total
	Breakfast/Lunch	Dinner		Breakfast/Lunch	Dinner			
						(E*B*C)+D*A*C		(G*F*Total Tourists)
Uber-wealthy	2	1	10	40	100	1800	10%	\$ 180,000,000.00
Average	1	1	7	20	60	560	60%	\$ 336,000,000.00
Budget	0.5	0.5	4	15	40	110	30%	\$ 33,000,000.00
							Total Market Revenue:	\$ 549,000,000.00
	Assumptions							
	Total Tourists	1000000						
	Total Restaurants on Island	25						
	Expected Op Margin	10%						
	Penetration	4%						
	Total Revenue Y1	\$ 21,960,000.00	(Round to \$22mm)					
	Profits Y1	\$ 2,196,000.00	(Round to \$2.2mm)					

Caribbean Restaurant

Approach / Analysis

Candidate should drive through analysis, comment on strength of \$550MM market revenue on such a small island, immediately move to find penetration figure and revenue of ~\$22MM

Candidate should immediately point out that profit of \$2.2MM falls short of target, but identify three drivers which make a difference (push to brainstorm if candidate doesn't offer):

- Market share (at ~5-6%, the client hits its target, may enjoy a 'bump' as the new spot on the block)

- Segment (if our client overindexes to higher spending segments, their revenue may increase)

- Cost Structure: If costs can be reduced, margin increases, and profit grows

Candidate should drive to recommendation of either "open" or "don't open" and justify based on data, while identifying risks

Possible risks of opening: Hurricanes, Competitive reaction, Supply Chain to remote island, staffing (only 5000 residents-how many qualified managers/staff can you find?)

Optional Section

If candidate flew through the case with time leftover, follow with:

The client decided to move forward and is about to open the restaurant next week. After an intensive marketing campaign, he is confident that he will earn \$3MM Y1, with 4% forecast annual growth for the foreseeable future.

Caribbean Restaurant

Approach / Analysis

A threatened competitor has just offered to buy the restaurant from him before he opens.

What would be an acceptable sale price for the restaurant?

Assumption: Discount Rate: 10%

Analysis: $\$3\text{MM}/(10\%-4\%) = \50MM

Recommendation: Candidate can suggest anything reasonable and justify based on client needs. Options include:
Refuse to sell for less than \$50MM.

Offer to sell for reasonable discount on valuation, as cash in hand is likely better than having to run the restaurant for years.

Offer to partner/JV with threatened competitor, increasing overall share on island and increasing overall value for both (they may find economies of scale or cost synergies in addition to market share)

Honeybuns

Business Situation

Prompt: Your client, MegaBox, is a privatized detention center management company that operates in the United States. The MegaBox board has an idea for a clandestine operation to grow profits: a honey bun business serving MegaBox's inmate population. They have hired you to figure out whether they should launch the business.

Problem Statement (Notes for interviewer)

Clarifying points:

- MegaBox's current business model is buying inmates from government facilities and making profits on margins (e.g. spending less on food).
- They're making about \$200M in profits a year, which is about average.
- Two sales channels: through prison commissary, through moles. Assume no difference in price or cost structure.
- Assume external parties are making the honey buns at a low price (e.g. retired grandmothers).

Other considerations:

- Assume we can finance this project with our current profits
- Assume other questions don't matter to the prompt
- If prompted, ask, "Why would you like to know that?"

Honeybuns

Approach / Analysis

Financials

- Revenues
 - Price (unit)
 - Volume (amount that can be produced)
 - Mix (different types of honeybuns?)
- Costs
 - CapEx
 - COGS (raw materials, price of final product)
 - SG&A (storage, granny salaries, extra pay for moles, transportation)
 - Spoilage
- Can we afford it?

Consumer

- Customers (inmates)
 - How many?
 - Willingness to pay (price sensitive?)
 - How do we capture them?
 - How do we retain them?

Market

- Market landscape
 - What are they eating now?
 - Other options (commissary goods)
 - Will this cannibalize commissary?

Nice-to-haves:

Product details, management team considerations, external considerations (PESTLE analysis), opportunity cost considerations (e.g. are our financial resources better suited elsewhere?)

Honeybuns

Approach / Analysis

Question 1: How profitable would this be for us? First, let's brainstorm what we need to calculate profitability.

Clarifying points:

- The price of the honey buns
- The COGS for honey bun sales
- The price of raw materials
- The price you are buying the honey buns for
- The SG&A for honey bun sales
- Storage costs
- Granny baking salaries
- Some extra pay for the moles
- Transporting the honey buns

Clarifying points:

- The number of prisoners that will consume the honey buns
- The frequency of honey bun consumption
- The amount of money prisoners will have to spend
- Commissary
- Non-commissary
- Alternative economies (e.g. bartering)
- The spoilage rates for honeybuns
- Upfront costs (we don't know this now, but will later)

Honeybuns

Exhibit 1

At end of brainstorm, please show interviewee Exhibit 1.

	2020
Honey Bun Price per Unit	\$5
Honey Bun COGS per Unit	\$2
Honey Bun Gross Margin per Unit	\$3
Honey Bun SG&A per Unit	\$2
Honey Bun Profit per Unit	\$1
% of inmates that will eat*	80%
Frequency of consumption	Every 2 nd day
\$ available, commissary, per month	\$200
\$ available, non-commissary, per month	\$100

Could you please calculate the monthly revenue and profits? Thoughts?

* Assume 20,000 inmates.

** Assume 30 days/month.

Honeybuns

Exhibit 1, Interviewer Only

At end of brainstorm, please show interviewee Exhibit 1.

	2020
Honey Bun Price per Unit	\$5
Honey Bun COGS per Unit	\$2
Honey Bun Gross Margin per Unit	\$3
Honey Bun SG&A per Unit	\$2
Honey Bun Profit per Unit	\$1
% of inmates that will eat*	80%
Frequency of consumption	Every 2 nd day
\$ available, commissary, per month	\$200
\$ available, non-commissary, per month	\$100
Total revenue, monthly	\$1,200,000
Total profit, monthly	\$240,000

Calculations

Revenue:

\$5 buns x
16,000 inmates x
15 days/month =
\$1.2M

Profit:

\$1.2M x
20% =
\$240K

Honeybuns

Exhibit 2

At end of brainstorm, please show interviewee Exhibit 1.

	2020	2021E
Honey Bun Price per Unit	\$5	20% increase
Honey Bun COGS per Unit	\$2	25% decrease
Honey Bun Gross Margin per Unit	\$3	TBA
Honey Bun SG&A per Unit	\$2	25% increase
Honey Bun Profit per Unit	\$1	TBA
% of inmates that will eat*	80%	Down 30%
Frequency of consumption	Every 2 nd day	Daily
\$ available, commissary, per month	\$200	\$250
\$ available, non-commissary, per month	\$100	\$150

Could you please calculate the projected monthly revenue and profits? Thoughts?

* Assume 20,000 inmates.

** Assume 30 days/month.

Honeybuns

Exhibit 2, Interviewer Only

	2021E	2021E
Honey Bun Price per Unit	20% increase	\$6
Honey Bun COGS per Unit	25% decrease	\$1.50
Honey Bun Gross Margin per Unit	TBA	\$4.50
Honey Bun SG&A per Unit	25% increase	\$2.50
Honey Bun Profit per Unit	TBA	\$2
% of inmates that will eat*	Down 30%	50%
Frequency of consumption	Daily	2x
\$ available, commissary, per month	\$200	\$250
\$ available, non-commissary, per month	\$100	\$150
Total revenue, monthly	\$1,800,000	
Total profit, monthly	\$600,000	

* Assume 20,000 inmates.

** Assume 30 days/month.

Calculations

Revenue:

\$6 buns x
10,000 inmates x
30 days/month =
\$1.8M

Profit:

\$1.8M x
33% =
\$600K

Honeybuns

Approach/ Analysis

Question 2: Our finance team has calculated that getting the honey bun business up and running would cost us a one-time \$20M upfront to get started. Megabox will not move forward with this investment unless it can break even within 3 years. How long would it take MegaBox to break even? Given this, should they move forward?

Calculation:

The easiest way to do this is to set up a formula:

First year profit + recurring profit(x) = upfront investment

Translated: $240,000 + 600,000(x) = 20,000,000$

The solution is 32.93~ months. This is an ugly number. It's less than 36 months (three years), so MegaBox will move forward.

Note: Some candidates might say it'll take over 30 years. Remind them about units if needed.

Bonus brainstorm:

What levers could Megabox pull to reduce the break-even time?

Anything unit level is fair game—recapturing lost market share from inmates, selling to administrative staff, lowering COGS/SG&A, etc.

Push on how they would do this.

Honeybuns

Approach/ Analysis

Question 3: Our medical team is concerned that health issues may emerge as a result of launching this honey bun business. How should MegaBox weigh the health issues with the financial benefits of launching?

Thoughts:

Physical health issues are the big ones: heart disease, diabetes.

Mental health issues are part of this, too: eating disorders, addiction.

The individual costs of care and probabilities for developing a health issue could be analyzed. Worth considering that developing health issues is more likely in a prison environment

The aggregate costs of medical should be considered: are we losing more on medical care than we are making in profits?

Bonus brainstorm:

How many inmates do you think we'd lose?

How much of our main business do you think we'd lose?

What additional ethical issues should we consider?

Ethical issues with letting inmates die if it's still profitable

Honeybuns

Exhibit 3

Option 1: Treat new health conditions

Treatment areas	Monthly costs, unit
Diabetes	\$60
Heart disease	\$20
Addiction	\$10
Eating disorders	\$10

Treatment areas	% inmates affected*
Diabetes	50%
Heart disease	25%
Addiction	60%
Eating disorders	90%

* Projected. Assume 2021 numbers.

Option 2: Go sugar free

	2021E
Honey Bun Price per Unit	\$6
Honey Bun COGS per Unit	\$1.50
Honey Bun Gross Margin per Unit	\$4.50
Honey Bun SG&A per Unit	\$2.50
Honey Bun Profit per Unit	\$2
% of inmates that will eat*	20%
Frequency of consumption	Every 2 nd day

	2021E
Treatment prices	90% lower

Honeybuns

Exhibit 3, Interviewer Only

Option 1: Treat new health conditions

Treatment areas	Total monthly costs
Diabetes	\$300,000
Heart disease	\$50,000
Addiction	\$60,000
Eating disorders	\$90,000
Total	\$500,000

	2021E
Previous total monthly profit	\$600,000
Monthly treatment costs	\$500,000
New total monthly profit	\$100,000

* Projected. Assume 2021 numbers.

Option 2: Go sugar free

	2021E
Honey Bun Profit per Unit	\$2
# of inmates that will eat*	4,000
Frequency of consumption	15
Adj. sugar-free total monthly profit	\$120,000

	2021E
Adj. sugar-free total monthly profit	\$120,000
Treatment prices	\$50,000
New total monthly profit	\$70,000

X
X

Honeybuns

Recommendation

Question 4: The MegaBox EVP is in the waiting room of the Zoom meeting and wants to know whether to launch this honeybun business. What will you tell her?

Thoughts:

This could go either way. Some considerations below.

No, profits aren't going to be high enough to break even in three years.

Yes, but only if we are willing to wait around 15 years to break even, or if we can pull additional cost saving levers on treatments.

Risks: alternative health risks unrelated to sugar would be the main one.

Mitigation: R&D to make product healthier, better tasting, more appealing

Next steps: Depends on yes/no answer. Should be implementable ASAP

Wrapping up:

Ask the candidate how they are feeling.

Congratulate them on finishing the case

Offer high-level feedback on ability to drive/talk through problems and ability to structure/execute math
